

REPORT

Project Objective

The primary objective of this project is to analyze bike-sharing station data to evaluate performance metrics across different cities. This includes tax revenue based on station status calculating tax revenue based on station status and assessing the cost efficiency of bike usage ultimately identifying underperforming regions to support data-driven decision-making.

Project Description

This project leverages power Bi to analyze bike – sharing efficiency across various cities. By calculating tax revenue through tax measures and mapping bike usage we have visualized city – level performance to identify underperforming regions with low cost efficiency. this data – driven approach highlights key operational gaps and supports informed decision – making.

Conclusion

The analysis reveals clear performance disparities across various cities. By visualizing the correlation between bike utilization and tax revenue we have successfully highlighted cities that are failing to meet expected efficiency standards. These insights provide a actionable foundation for management to investing the causes of low performance in specific regions and optimize operations to enhance overall revenue generation.
